

# #1 Cloud-Native Patch Management

For Work-From-Anywhere Workplaces

Action1 is the purpose-built remedy for your patch management pain. Unlike most remote monitoring and management tools that have it as a neglected feature, Action1 is laser-focused on patch management as its core competency.

## Detect

Real-time visibility into missing critical updates for Windows and third-party applications.

## Patch

Patching of on-site and remote devices without VPN and even if they are offline.

## Comply

99% patch compliance in hours, not months, real-time compliance reporting.

“With our previous tool, we were under constant risk, as 20% of our network was not being patched with security updates because they were off-site or not joined to our company domain. Action1 addresses this security gap by enabling us to establish a robust patch management program that covers 100% of our devices.”

Joe Holder, IT Director at The Arthur Companies

#1 Cloud-Native Patch Management  
For Work-From-Anywhere Workplaces

# Key Features

## Keep OS patched

Patch Windows OS on all workstations and servers, even if they are not on a corporate network or not joined to a domain.

## Patch applications

Update most common applications, curated and tested by Action1, as well as your custom apps, from a single console.

## Detect missing updates

Know exactly what patches are missing on what endpoints and be notified about new Windows updates.

## Approve updates

Test and approve patches before the rollout. Specify whether updates have to be approved manually or deployed automatically.

## Assign patching policies

Prioritize patches and schedule update deployments to meet your policy requirements and avoid user downtime.

## Prove compliance

Monitor patching results, see when each endpoint was last updated, and report on installed updates.

## Why Action1?

### VPN-free

Patch remote and onsite endpoints with Action1 cloud-native platform. No company network, domain, or VPN required.

### Fast time-to-value

Get up and running and start getting value in one hour. No legacy tools, clunky integrations and feature overload.

### P2P distribution

Deliver software and updates faster while ensuring network availability for critical applications.

### Patching offline devices

Improve your patch success rates by automatically installing patches, as soon as endpoints get back online.
